

Impacts of variable depth on weak-lensing covariance

Chieh-An Lin (Linc)

June 28th, 2019

Institut d'Astrophysique de Paris

3×2pt analysis

- Galaxy position: biased tracer of matter
- Galaxy shape: noisy tracer of projected matter

$\langle \text{position position} \rangle$  galaxy clustering w

$\langle \text{position shape} \rangle$  galaxy-galaxy lensing γ_+

$\langle \text{shape shape} \rangle$  cosmic shear ξ_{\pm}

State of the art

KiDS Collaboration
(van Uitert et al. 2018)

DES Collaboration (2018)

3x2pt: better constraints

Hildebrandt et al. (2019), Hendrik's talk

Systematics

(a reminder for Elisabeth's talk)

Maria Cristina's talk

- Redshift distributions
- Intrinsic alignment
- Shape measurement
- Galaxy bias

Asgari et al. in prep., Marika's talk

Systematics

- Baryon feedbacks or scale cuts
- Survey effects (this talk)
- etc.

Covariance is (one of) the key(s)

Estimation from data

Analytical formalism

N -body simulations

Covariance is (one of) the key(s)

Estimation from data

- Risky if subsamples are correlated

Analytical formalism

- Challenging to include survey effects

N -body simulations

- Missing large modes: box size
- Missing small modes: particle mass
- Time consuming

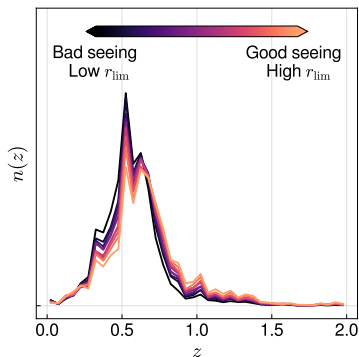

Survey effect 1: mask geometry

■ Masked ■ BOSS-only ■ KiDS-only ■ Overlap

(KiDS-1000 data, preliminary)

Redshift distributions $n(z)$,
source density n_{eff} ,
and shape noise σ_ϵ
vary with r -band
magnitude limit r_{lim} .

Survey effect 2: variable depth

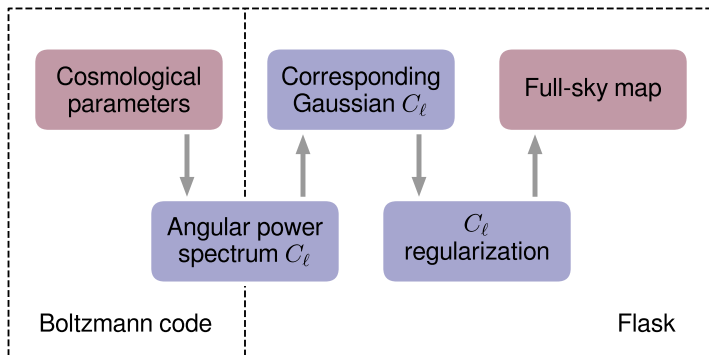

Challenges

What is the impact of survey footprints on the weak-lensing covariance?

Methodology

FLASK (Xavier et al. 2016)

Fast Gaussian/lognormal simulations

Methodology

- Compute C_ℓ from input parameters
- Generate density & lensing maps
- Apply survey effects
- Sample galaxies
- Compute correlation functions

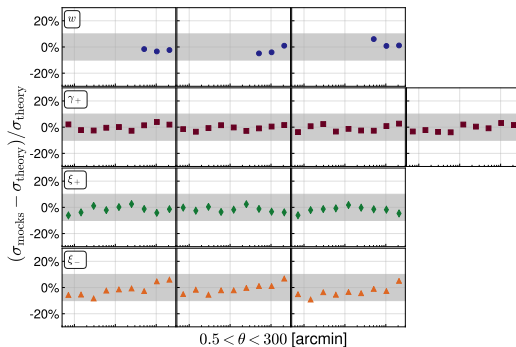

Test case with 2 lens bins & 2 source bins

Comparisons with theory

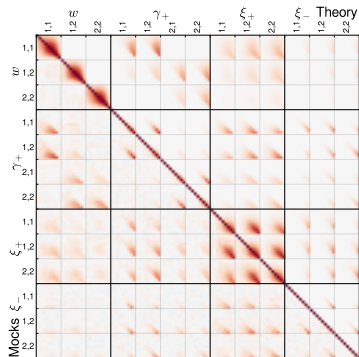

Comparisons with theory

Diagonal (std)

Off-diagonal (correlations)

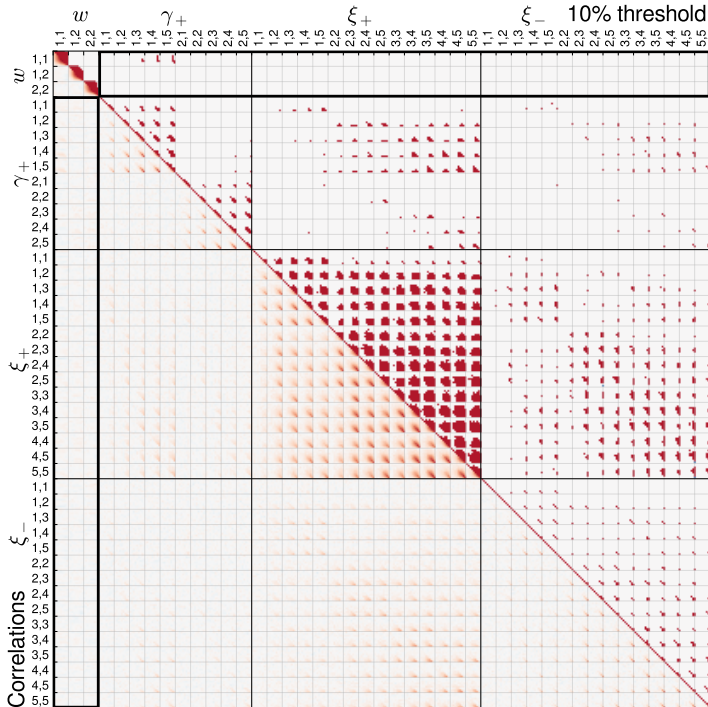

Preliminary results

Are cross-
correlations
negligible?

■ Masked ■ BOSS-only ■ KiDS-only ■ Overlap

Preliminary
results

Are cross-
correlations
negligible?

Yes

Preliminary results

~1% effect on mean

~5% effect on covariance

- Variable depth of weak-lensing sources affects the likelihood analysis.
- KiDS-like survey: $\sim 1\%$ bias on mean and $\sim 5\%$ on covariance.
- Will be significant as statistical errors decrease for future surveys.

Comparisons with theory

Covariance

$$C_{\text{tot}} = \underbrace{\langle SS \rangle}_{\text{cosmic term}} + \underbrace{\langle SN \rangle}_{\text{mixed term}} + \underbrace{\langle NN \rangle}_{\text{noise term}}$$

$$\langle SS \rangle = \underbrace{C_G}_{\text{Gaussian term}} + \underbrace{C_{\text{NG}}}_{\text{non-Gaussian term}} + \underbrace{C_{\text{SS}}}_{\text{super-sample term}}$$

Clustering: impacts from Limber & slicing
